Final exceptions summary

Completion decision | 12 October 2026 | Applies to individual findings, not a blanket project assurance

Finished as an independent public-data financial analysis. Suitable for interviews and conditional GitHub publication; no defensible fair-value target is claimed.

Finding / status	Final position
Historical evidence: VERIFIED F and D(F)	Preserved the previously verified 240 historical financial-data cells and completed corrections. The delivered 20-sheet workbook is byte-identical to the latest corrected version; no general audit was repeated.
Targeted arithmetic: CONDITIONAL D(F,E,A)	Independent checks passed for annual registration/cash/BS identities, transfer balances, FCFF cash/accounting bridges, selected debt/coupon balances, six saved scenario/financing DCF cases and three existing reinvestment sensitivities. Correct arithmetic does not verify forecasts.
U01: CRITICAL / UNVERIFIED Fair-value claim: FAILED, withdrawn	Terminal amortisation £137.7m is imposed as £153m purchases less £15.3m disposed book value. Existing cohorts imply £48.6m next-year runoff before new transactions. Sustainable renewal economics and the terminal transition remain unsupported; retain the DCF only as a sensitivity.
Forecast and funding: CONDITIONAL A and D(F,A)	Revenue, wages, purchases, sales, lives, settlement dates, taxes and future refinancing remain assumptions. Repayment creates a cash gap in every case; Downside remains underfunded with rollover. Undrawn capacity is subject to contractual conditions.
Other prior major exceptions: OPEN U / A	Private regulatory inputs; historical transaction-level cash residuals; tax/covenant approximations; incomplete levy and final regulatory-period coverage; non-harmonised peer context. These are unchanged, not resolved by this pass.
Native Excel: UNVERIFIED	Excel was unavailable. No native full recalculation, live What-If refresh, repair-warning or save/reopen test is claimed. Saved calculations were independently reproduced; the full engine/source audit was not rerun.

What changed in this final pass

No numerical workbook changes. The final memo and guide explain the cohort discontinuity, show only three existing reinvestment stress points and remove any fair-value interpretation. DCF outputs are unchanged because no supported replacement input was established. Prior source records and verified work are preserved.

Safe interview conclusions and publication decision

Discuss accounting versus cash, instalment exposure, recurring wages, debt maturities, liquidity sensitivity and the limits of valuation. Do not call a scenario an internal budget, a proxy actual regulatory compliance, rollover secured funding, or a floored DCF a price target. There is no new demonstrated material arithmetic error; U01 and the listed major assumptions remain open.

Only necessary action before final tested release: native Excel full recalculation and save/reopen, all three operating scenarios with both financing settings, live sensitivity refresh and reconciliation to the disclosed outputs. Publish with these exceptions and existing source register. New evidence for terminal renewal is necessary only if a fair-value claim is later sought; it is not a prerequisite for publishing a clearly labelled sensitivity project.

F verified public fact; **E** market-derived input; **A** selected assumption; **D** calculation, with input classes shown; **U** unsupported. Forecasts are not verified future outcomes.
